

Mini-project as an alternative to the written exam

- **Mini-project: Design and Prototype of an Innovative Web Application**
- Individual project
- Alternative to the written exam
- Design an original web application idea
- Present the process from concept to prototype

Main goal

- Propose a meaningful web application for a specific user group
- Show how the solution was developed from:
 - idea
 - requirements
 - user analysis
 - wireframe
 - mockup
 - prototype
- Focus on both the solution and the design process

Project must include

- short problem description
- target users
- 1–2 user personas
- main functional and non-functional requirements
- simple use case model
- wireframes of key screens
- at least one mockup
- interactive prototype
- short explanation of how the design evolved

Design trends

- **Use 2–3 modern web design trends**
- Examples:
 - responsive / mobile-first design
 - dark mode
 - microinteractions
 - Motion UI
 - storytelling
 - bold typography
- You must explain:
 - why these trends were selected
 - how they fit the users and the project
 - how they improve UX

Technical scope

- The main focus is on design and prototyping
- A full backend implementation is **not required**
- You may build:
 - an interactive prototype, or
 - a simple functional front-end prototype
- Backend functionality is optional

Important limitations

- The project must be based on an original idea
- It must **not** be the same as the project developed in practical classes
- It must **not** be only a small modification of a lab solution
- It must **not** repeat a lecture example, tutorial, or demo
- If the idea is too similar to a lab project, it will not be accepted

Topic approval

- Before starting the project, send a short proposal to: bostjan.sumak@um.si
- The proposal should include:
 - working title
 - main idea
 - target users
 - problem to be solved
 - main planned features
- You may start only after the topic is approved.

What to submit & present

- short presentation
- personas and main requirements
- use case diagram
- wireframes / mockups
- interactive prototype
- short report on the design and prototyping process
- explanation of selected design trends and key design decisions
- <https://ucilnice.arnes.si/mod/assign/view.php?id=6645894>
- Deadline: 7.6.2026, 20:00

Additional recommendation

- Students are encouraged to clearly distinguish between:
 - the initial idea,
 - the first design concepts,
 - the improved version,
 - and the final prototype.
- They should also briefly explain:
 - which design decisions were changed during development,
 - what problems they discovered,
 - and how the prototype improved over time.
- The focus of the project is not only on the final screen design, but on the ability to present a **structured and well-justified design and prototyping process**.
