

Project Introduction (Overview)

Project Title:

DiscoverEat (*or we can brainstorm a better name later*)

Description:

DiscoverEat is a mobile and web-based application designed to help users discover the most suitable restaurants in any city based on their personal needs — whether it's a family dinner, a romantic date, a meeting with friends, or a business lunch.

Unlike existing platforms, this app does **not support food delivery or ordering**. Instead, it provides rich, visual restaurant profiles that include **videos of how food is served**, detailed **menus with prices**, **restaurant atmosphere**, and most importantly, **filters based on occasion and purpose**.

Restaurants can create accounts, manage their profiles, and upload media that showcases their ambiance, food quality, and unique services.

Project Goals:

- Help users quickly find the best restaurant for any **specific social setting**
- Give restaurants a platform to **visually showcase** their brand and experience
- Create a map-based, visually rich restaurant discovery experience with **zero ordering**

Core Features:

For Users:

-  **Map-based search** with location filtering
-  Filter restaurants by purpose: *Date / Family / Friends / Business*
-  View menus with prices, dishes, and serving styles
-  Watch official videos/photos uploaded by the restaurant
-  Save restaurants to a personal list

For Restaurants:

-  Register and manage a restaurant profile
-  Upload menu, food photos, and serving videos
-  Set address, contact info, and tag for occasions
-  View engagement analytics (basic for MVP)

Technical Infrastructure Overview

Here's a **high-level system architecture** of how the app will be built:

1. Frontend

- **Mobile App:** React Native (via Expo)
- **Web App:** React.js (Next.js optional for SEO)
- **Features:** Search, filters, map, restaurant detail pages, user login

2. Backend (API Server)

- **Technology:** Node.js with Express
- **Authentication:** Firebase Auth or JWT-based system
- **APIs:**
 - User login/signup
 - Get/filter restaurants
 - Restaurant CRUD (for admins)
 - File upload endpoints

3. Database

- **Preferred:** PostgreSQL (structured, reliable)
- **Alternative:** Firebase Firestore (for quicker MVP)
- **Main Entities:**
 - Users
 - Restaurants
 - Media (photos/videos)
 - Tags (dating, family, etc.)

4. Storage

- **Cloudinary** or **Firebase Storage** (to store images/videos)

5. Map Integration

- **Google Maps API:** For restaurant locations and search by map

Optional Future Features

- AI-based restaurant suggestions (OpenAI / Langflow)
- Real-time chat with restaurants
- Voice search ("Show romantic restaurants near me")
- Multilingual support (Turkish, English, etc.)

🎯 Summary Sentence (Pitch Line)

“DiscoverEat is a visual restaurant discovery app that helps you find the perfect place to eat based on occasion — with videos, menus, and map-based search — without the clutter of food delivery.”
